Retail Sales Data Transformation
Pandas Practice Questions | Lessons 4 and 5
Question 18 - Currency Conversion
Using the Total_Amount column, create a new column named total_amount_usd by converting sales
amounts from South African Rand (ZAR) to US Dollars. For this exercise, assume 1 ZAR = 0.055 USD.
Question 20 - Quantity-to-Age Ratio
Create a new column named quantity_age_ratio by dividing the Quantity column by the Age column.
Question 21 - Sales per Item
Create a new column named sales_per_item by dividing Total_Amount by Quantity. Compare the
result with the price per unit.
Question 22 - Adjusted Sales
Assume all products experience a 10% price increase. Create a new column named adjusted_sales
containing the updated transaction amounts.
Question 23 - Percentage of Total Sales
Create a new column named sales_percentage that calculates each transaction's contribution to overall
sales revenue as a percentage.
Question 24 - Quantity Percentage
Create a new column named quantity_percentage that calculates each transaction's quantity as a
percentage of the total quantity sold.
Question 25 - Age Relative to Average Age
Create a new column named age_ratio by dividing each customer's Age by the average age of all
customers in the datase
